Variable Displacement

Specifications and Performance

Technical Data

SIZE			55	75	108	161	225
Displacement	$V_{g \max}$	cm ³ /rev (in ³ /rev)	54.8 (3.34)	75.3 (4.60)	107.5 (6.56)	160.8 (9.81)	225.1 (13.73)
Displacement	$V_{g \min}$	cm ³ /rev (in ³ /rev)	15.8 (0.96)	21.7 (1.33)	31.0 (1.89)	46.4 (2.83)	64.9 (3.96)
Max. pressure	cont.	p_{nom}	bar (psi)	350 (5100)	350 (5100)	350 (5100)	350 (5100)
Max. pressure	peak	p_{max}	bar (psi)	450 (6500)	450 (6500)	450 (6500)	450 (6500)
Max. flow		q_{max}	l/min (U.S. gpm)	214 (56.5)	263.5 (69.5)	344 (90.5)	450 (118.5)
Max. speed at $V_{g \max}$	$e_{q \max}$	n_{max}	rpm	3900	3500	3200	2800
Max. speed at $V_{g \max} < e_{q \max}^{(3)}$		$n_{max \lim}$	rpm	5100	4600	4200	3600
Torque constant at $V_{g \max}$		T_k	Nm/bar (lb _f - ft/psi)	0.87 (0.044)	1.20 (0.061)	1.71 (0.087)	2.56 (0.13)
Max. power at q_{max}	motor	p_{max}	kW (hp)	125 (167)	154 (206)	201 (269)	263 (352)
Max. torque at $V_{g \max}$	cont. (p_{nom})	T_{nom}	Nm (lb _f - ft)	305 (224.5)	420 (310)	599 (442)	896 (661)
Max. torque at $V_{g \max}$	peak (p_{max})	T_{max}	Nm (lb _f - ft)	392 (289)	540 (398)	770 (568)	1152 (849)
Moment of inertia (rotating J group)			kg m ² (lb _f - ft ²)	0.004 (0.095)	0.008 (0.189)	0.013 (0.308)	0.025 (0.593)
Weight ⁽¹⁾	m	kg (lbs)	29 (64)	41 (90)	54 (119)	76 (168)	106 (234)
Drainage flow ⁽²⁾	q_d	l/min (U.S. gpm)	1.5 (0.39)	2.0 (0.53)	2.8 (0.74)	3.6 (0.95)	4.9 (1.29)

(Theoretical values, without considering n_{hm} or n_v ; approximate values). Peak operations must not exceed 1% of every minute. A simultaneous maximum pressure and maximum speed not recommended.)

⁽¹⁾ Approximate values.

⁽²⁾ Average values at 250 bar (3600 psi) with mineral oil at 45 °C (113 °F) and 35 cSt of viscosity.

⁽³⁾ Determination of allowable speed n_{max} value can be increased by reducing motor maximum displacement. To determine the relationship between $V_{g \max}$ and n_{max} use the right side chart. Motor maximum allowable speed is $n_{max \lim}$.

Variable Displacement Model Codes

The following 25-digit coding system has been developed to identify standard configuration options for Bent Axis Variable Displacement Motors. Use this model code to specify a motor with the desired features. All 25 digits of the code must be present to release a new product number for ordering.

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25

All Eaton variable displacement motors configured with opposite side ports can be specified with optional shuttle valves.

This feature is used to remove hot oil from the low pressure side of a closed circuit. The system charge pump replenishes this oil with cooled, filtered oil from the reservoir. Shuttle valves are recommended in closed circuit applications, especially when operating at high speeds and power levels.

The valve block is mounted to an adapter plate attached to the rear of the motor.

Two versions of the shuttle valve are available. Consult the table below for specifications and ordering codes.

CODE	SHUTTLE VALVE	DISPLACEMENT 55	75	108	161	225
1	8.5 lpm (2.25 gpm) @ 305 psi	Requires port option L or E	Requires port option M or F	Requires port option M or F	Requires port option N or G	Requires port option N or G
2	20 lpm (5.3gpm) @ 305 psi					
ø	No Shuttle

Variable Displacement

Control Options

Model Code Pos. 12,13

Pressure Response Control

Code: PA

The pressure response control shifts the variable motor to satisfy system torque requirements.

The motor is biased to minimum displacement and remains at this setting until the motor's torque demand increases system pressure to the preset shift point, causing the motor displacement to increase to the maximum displacement setting.

At maximum displacement, the motor provides maximum torque for a given pressure. When at minimum displacement, the motor provides the maximum output speed for a given flow rate.

Control operation occurs when system pressure creates a force on the spool which exceeds the force of the adjustable control spring.

The motor remains at minimum displacement until system pressure creates a force exceeding the preset spring force, opening the spool, shifting the motor to maximum displacement.

A minimum system operating pressure of approximately 40 bar (580 psi) is required to operate the control. Pressure increase during the motor shift from minimum to maximum displacement

is approximately 15 bar (220 psi).

Control shift pressure can be specified in 20 bar [290 psi] increments from 100 to 350 bar (1450 to 5000 psi).

Select desired pressure in model code position 14.

Variable Displacement

Control Options

Model Code Pos. 12,13

Pressure Response Control with Adjustable Hydraulic Over-ride

Code: PB

The PB control operates in the same manner as the standard Pressure Response control until pilot pressure is applied to port X2.

This pressure over-rides the preset shift pressure, by reducing the system pressure required to shift the motor to maximum displacement.

The motor's shift pressure setting is reduced proportionally to the pilot pressure at port X2 by the ratio of 13:1. (e.g. for each 10 psi of pilot pressure, shift pressure is reduced by 130 psi)

The maximum pressure which can be applied at port X2 = 50 bar (725 psi).

Minimum system pressure of 40 bar [580 psi] bar pressure is required to operate the control. Pressure rise during the motor shift from minimum to maximum displacement is approximately 15 bar (220 psi).

Control shift pressure can be specified in 20 bar [290 psi] increments from 100 to 350 bar (1450 to 5000 psi).

Select desired pressure in model code position 14.

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example below).

Variable Displacement Control Options

Model Code Pos. 12,13

Hydraulic Proportional Control

Code: HA (bias to max.)

HB (bias to min.)

The hydraulic proportional control allows infinitely variable adjustment of the motor displacement proportional to the pilot pressure applied at port X2.

The pilot pressure generates a force on the control spool, shifting the motor displacement until the feed-back spring force equals that of the pilot pressure. Motor displacement is adjusted in direct proportion with the pilot pressure.

The standard control configuration is with the control biased to maximum displacement, and pilot pressure shifting the motor to minimum displacement.

Pilot pressure range: 6 bar (87 psi) to 18 bar (260 psi)

The maximum pressure which can be applied at port X2 = 50 bar (725 psi).

Minimum system pressure of 40 bar [580 psi] bar pressure is required to operate the control.

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example below).

Control operation is the same as for HA, but with logic reversed. Pilot pressure shifts the motor from it's bias position at minimum displacement to maximum.

Pilot pressure range from 6 bar (87 psi) to 18 bar (261 psi).

The maximum pressure which can be applied at port X2 = 50 bar (725 psi).

Minimum system pressure of 40 bar [580 psi] bar pressure is required to operate the control.

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example above).

Hydraulic Two-Position Control

Code: H1 (bias to max.)

H2 (bias to min.)

The hydraulic two-position control allows the displacement of the motor to be shifted by applying pilot pressure to port X2.

Control operation is similar to Hydraulic Proportional control, except there is no feedback mechanism, therefore only maximum and minimum displacements can be set.

Minimum required pilot pressure = 15 bar (220 psi). The maximum pressure which can be applied at port X2 = 50 bar (725 psi).

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example below).

Control operation is the same as for H1, but with logic reversed. Pilot pressure shifts the motor from it's bias position at minimum displacement to maximum.

Minimum required pilot pressure = 15 bar (220 psi). The maximum pressure which can be applied at port X2 = 50 bar (725 psi).

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example above).

Variable Displacement

Control Options

Model Code Pos. 12,13

Electric Two Position Control

Code: E1 (bias to max.) 12V
E2 (bias to min.) 12V

The electric two-position control allows the displacement of the motor to be shifted by switching an ON/OFF solenoid valve. Control operation is similar to Electrical Proportional control, except there is no feedback mechanism, therefore only maximum and minimum displacements can be set.

Code: E3 (bias to max.) 24V
E4 (bias to min.) 24V

12V DC and 24V DC ON/OFF solenoid are available. (Note model codes/descriptions above)

E1 and E3 options are normally at maximum displacement, and shift motor to minimum displacement when the solenoid is turned on.

E2 and E4 options function similarly, but with reverse logic. Control is biased to

minimum displacement and shift to maximum displacement when the solenoid is turned on.

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example above).

Variable Displacement Control Options

Model Code Pos. 12,13

Electric Proportional Control

Code: EA (bias to max.) 12V
EB (bias to min.) 12V

The electrical proportional control allows infinitely variable, programmable adjustment of the motor displacement proportional to current applied to the solenoid coil.

The proportional solenoid applies force on the control spool, shifting the motor displacement until the feedback spring force equals that of the solenoid force. Motor displacement is adjusted in direct proportion with the electrical current.

Code: EC (bias to max.) 24V
ED (bias to min.) 24V

Controls are offered with either 12V or 24V solenoids.

In the standard configuration (Codes EA and EC) the motor is biased to maximum displacement, and solenoid force shifts the motor to minimum displacement.

Solenoids are controlled by 24 V (12 V) DC supply with current levels between approximately 250 (500) and 700 (1400) mA.

Max current which can be applied to the solenoid is 800 (1600) mA.

Recommended PWM frequency of 110 Hz.

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example above).

Contact Eaton for optional solenoid driver information.

Code: EA (bias to max.) 12V

Variable Displacement Control Options

Model Code Pos. 12,13

Electric Two Position Control with Pressure Response

Code: E5 (bias to max.) 12V
E6 (bias to max.) 24V

The control operates similar to Code options E1 and E3, when the solenoid is turned off the motor is biased to maximum displacement.

When the solenoid is turned on, the motor shifts to minimum displacement and remains at that setting unless system pressure rises beyond the pre-set shift pressure setting. The control then over-rides the electrical setting, by shifting the motor to maximum displacement.

Minimum system pressure of 40 bar [580 psi] bar pressure is required to operate the control. Pressure rise during the motor shift from minimum to maximum displacement is approximately 15 bar (220 psi).

Control shift pressure can be specified in 20 bar [290

psi] increments from 100 to 350 bar (1450 to 5000 psi).

Select desired pressure in model code position 14.

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example below).

The control operates similar to Code options E1 and E3, when the solenoid is turned off the motor is biased to maximum displacement.

When the solenoid (24 V two-position) is turned on, the motor shifts to minimum displacement and remains at that setting unless system pressure rises beyond the pre-set shift pressure setting. The control then over-rides the

076, 087, 108, 225

055

electrical setting, by shifting the motor to maximum displacement.

Minimum system pressure of 40 bar [580 psi] bar pressure is required to operate the control. Pressure rise during the motor shift from minimum to maximum displacement is approximately 15 bar (220 psi).

Control shift pressure can be specified in 20 bar [290 psi] increments from 100 to 350 bar (1450 to 5000 psi).

Select desired pressure in model code position 14.

Control boosting: If it is necessary to shift the motor displacement when system pressure is less than 40 bar (580 psi), an auxiliary boost circuit must be supplied (see example above).

Variable Displacement

Control Options

Model Code Pos. 12,13

Manual Control

Code: M1 (bias to max.)
M2 (bias to min.)

The motor displacement is adjusted from maximum displacement to minimum displacement by manually operating the hand-wheel.

The motor displacement is adjusted from minimum displacement to maximum displacement by manually operating the hand-wheel.

The following table shows number of hand wheel turns required to shift the motor from minimum displacement to maximum displacement or viceversa:

Dimensions	55	75	108	160	226

Fixed Displacement Model Codes

The following 25-digit coding system has been developed to identify standard configuration options for Bent Axis Fixed Displacement Motors. Use this model code to specify a motor with the desired features. All 25 digits of the code must be present to release a new product number for ordering.

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25

Fixed Displacement

Valve Options

Model Code Pos. 11

Eaton fixed displacement motors, with opposite side, or same side-bottom ports can be specified with optional shuttle valves.

This feature is used to remove hot oil from the low pressure side of a closed circuit. The charge pump replenishes this oil with cooled, filtered oil from the reservoir.

Shuttle valves are recommended in closed circuit applications, especially when operating at high speeds and power levels.

For units with opposite side ports, the valve block is mounted directly to the motor endcover. Motors with same side-bottom ports require an adapter block to mount the shuttle valve block.

Two versions of the shuttle valve are available. Consult the table below for specifications and ordering codes.

CODE	SHUTTLE VALVE	DISPLACEMENT		040	044	055	075	087	108	161	225

Application Information

Hydraulic fluids:

Premium grade petroleum based hydraulic fluids will provide the best performance in Eaton hydraulic components. These fluids typically contain additives that are beneficial to hydraulic systems. Eaton recommends fluids that contain anti-wear agents, rust inhibitors, anti-foaming agents, and oxidation inhibitors. Premium grade petroleum based hydraulic fluids carry an ISO VG rating.

Viscosity range at operating temperature must be of 15 - 40 cSt. For short periods and upon cold start, a max. viscosity of 800 cSt is allowed. Viscosities less than 10 cSt are not recommended. A viscosity range of 10 -15 cSt is allowed for extreme operating conditions and for short periods only. For further information see the Fluids and Filtration Guidelines section (pages 66-68) or Eaton Hydraulic Fluids Recommendations (3-401).

Temperature ranges:

The operating temperature of the oil must be between -25°C and 90°C (-13°F to 194°F).

Operation at temperatures above 90°C (194°F) or lower than -25°C (-13°F) is not recommended.

For further information see the Fluids and Filtration Guidelines section (pages 66-68) or Eaton Hydraulic Fluids Recommendations (3-401).

Filtering:

Proper filtration and oil cleanliness are essential for long life and satisfactory performance of bent

axis piston units. Maximum allowable contamination class is 19/16 in accordance with ISO 4406 (6 per SAE).

For further information see the Fluids and Filtration Guidelines section (pages 66-68) or Eaton Hydraulic Fluids Recommendations (3-401).

Operating pressure:

Maximum operating pressure on main system ports of Eaton bent axis motors is 350 bar (5000 psi) continuous, and 450 bar (6500 psi) peak. If two motors are connected in series, working pressure has to be limited to following values:

$$(P_{inlet} + P_{outlet}) < 350 \text{ bar} \\ (5000 \text{ psi}) \text{ continuous}$$

$$(P_{inlet} + P_{outlet}) < 400 \text{ bar} \\ (6500 \text{ psi}) \text{ peak.}$$

Case drain pressure:

Maximum recommended motor case pressure is 3.0 bar (44 psi) and 5.0 bar (73 psi) peak. Excessive case pressure will reduce the life of the main shaft seal.

Seals:

Eaton bent axis motors are equipped with standard NBR (Acrylonitrile-Butadiene Elastomer) for temperatures up to 90°C. For special uses (high temperatures or special fluids) optional Fluorocarbon seals can be specified up to temperatures of 120°C. If using special fluids, contact Eaton Hydraulics.

Output shaft:

Main shaft bearings can bear both radial and axial loads. For details of allowable loading, contact your Eaton representative.

Minimum rotating speed:

Minimum operating speed is the minimum motor rpm at which smooth rotation is assured. Smooth operation at low speeds depends on many factors, such as the type of load and operating pressure.

At speeds of 150 rpm and higher, the motor output shaft will rotate smoothly under most operating conditions. Operation at speeds below 150 is usually acceptable. Please contact Eaton Hydraulics.

Installation:

Eaton bent axis motors can be installed in most orientations. Units have two case drain ports and care must be taken to ensure that motor cases remain full at all times. Always use the case drain port on the highest point on the motor. Gearbox mount motors may not be installed in a vertical orientation with the shaft pointing upwards.

For further details see at General installation guidelines

Valves:

Flange mounted shuttle valves are available for flushing and cooling of closed circuit systems. Two different flow rate options can be selected depending on duty cycle requirements..

Variable Motor System Ports:

Variable motor end-covers have both Opposite side and Rear ports. Unused ports are plugged with blind flanges. Port selection is made in model code position 10 of the variable motor model code found on page 6

Relationship between direction of rotation and direction of flow:

Bent Axis Motors

Application Information

Fluid and Filtration Guidelines

1. Types of fluid

The table below shows the main categories of hydraulic fluid as referenced in ISO 6743- 4. Under normal operating conditions, Eaton Hydraulics recommends mineral oil-based fluids with anti-corrosive and anti-wear additives (HL or HM grade) for its bent-axis piston units. Flame-resistant fluids (HF grade) and organic fluids (HE grade) may not be fully compatible with materials and may therefore reduce the maximum pressure and speed specification of Bent Axis piston units. Customers are advised to contact Eaton Hydraulics before using flame-resistant or organic fluids.

MINERAL OIL-BASED FLUIDS	
HH	Additive-free
HL	Anticorrosive, antioxidant
HM	HL and anti-wear additives
HV	HM additives and viscosity controls

2. Viscosity index

The optimum viscosity of the hydraulic fluid at normal system operating temperature (temperature of the tank for open circuits or temperature of the circuit for closed circuits) must fall between the minimum and maximum values shown below.

The minimum viscosity shown is permitted in extreme conditions and for short intervals. This value refers to a maximum fluid temperature of 90°C (temperature at case drain).

The maximum viscosity for short intervals and during cold starts is shown below.

The temperature of the fluid should not exceed a maximum of +90°C or minimum of -25°C.

VARIABLE AND FIXED DISPLACENIC FLUIDS	
Optimum	15-40 (cSt)
Minimum	10 (cSt)
Maximum	800 (cSt)

3. Viscosity grades

Under the ISO standard, hydraulic fluids are divided into 6 grades of viscosity. In order to choose the correct type of fluid, it is essential to know the operating temperature of the fluid (temperature of the tank for open circuits or temperature of the circuit for closed circuits). At normal system operating temperature, the viscosity of the fluid must fall within the optimum viscosity range above.

4. Contamination grades

Efficient filtering is essential for hydraulic systems to operate properly. A good quality fluid extends the working life of hydraulic parts and makes the system more reliable

Bent Axis Motors

Application Information

Fluid and Filtration Guidelines (cont.)

5. Filtering grade

ISO 4572 states that the filtering grade β_x is the ratio between the number of particles of contaminant (per unit volume) of a size greater than or equal to x mm entering the filter and the number of particles of the same size leaving the filter. The grade β_x therefore gives a good indication of the quality of the filter.

Example: A filter with a filtering ratio of $\beta_{20} \geq 100$ is able to capture all particles greater than or equal to 20 μm . Eaton Hydraulics recommends filters with the following β_x ratios for its Bent Axis piston motors:

MAXIMUM CONTAMINATION GRADES	ISO	NAS 1638
Fixed and Variable Bent Axis Motors	19/16	10

RATIO β_x	FILTERING EFFICIENCY	NOTES
2	50%	Average size of filter pores equal to smallest particles
20	95%	Normal retention
100	99%	Absolute retention

CONTAMINATION GRADE ISO 4406	RATIO β_x
19/16	$\beta_{20} \geq 100$
18/15	$\beta_{10} \geq 100$

6. ISO 4406 table

The two figures in the code show the number of solid particles per fluid volume unit greater than 5 and 15 microns respectively. Grade 18, for example, indicates that the number of particles per ml is between 1300 and 2500. The table below shows recommended contamination grades set out in ISO 4406.

NUMBER OF PARTICLES PER ML	GREATER THAN 5 μm	GREATER THAN 15 μm
Code	From-to	From-to
20/17	5.000-10.000	640-1.300
20/16	5.000-10.000	320-640
20/15	5.000-10.000	160-320
20/14	5.000-10.000	80-160
19/16	2.500-5.000	320-640
19/15	2.500-5.000	160-320
19/14	2.500-5.000	80-160
19/13	2.500-5.000	40-80
18/15	1.300-2.500	160-320
18/14	1.300-2.500	80-160
18/13	1.300-2.500	40-80
18/12	1.300-2.500	20-40
17/14	640-1.300	80-160
17/13	640-1.300	40-80
17/12	640-1.300	20-40
17/11	640-1.300	10-20
16/13	320-640	40-80
16/12	320-640	20-40
16/11	320-640	10-20
16/10	320-640	5-10
15/12	160-320	20-40
15/11	160-320	10-20
15/10	160-320	5-10
15/9	160-320	2,5-5
14/11	80-160	10-20
14/10	80-160	5-10
14/9	80-160	2,5-5
14/8	80-160	1,3-2,5
13/10	40-80	5-10
13/10	40-80	2,5-5
13/10	40-80	1,3-2,5
12/9	20-40	2,5-5
12/8	20-40	1,3-2,5
11/8	10-20	1,3-2,5

7. Comparison between ISO 4406, NAS 1638 and SAE

The table below is a comparison between standards ISO 4406 (Cetop RP 70 H), NAS 1638 (1964) and SAE (1963).

ISO 4406 (CETOP RP 70 H)	NAS 1638 (1964)	SAE (1963)
21/18	12	-
21/17	11	-
19/16	10	-
18/15	9	6
17/14	8	5
16/13	7	4
15/12	6	3
14/11	5	2
13/10	4	1
19/9	3	0
18/8	2	-
10/7	1	-
9/6	0	-

Bent axis design motors and pumps: Flushing the bearings

The operating temperature influences the operating life of the bearings to a significant degree. As a result it is essential to maintain oil temperature at the bearings at acceptable levels.

Fixed and Variable displacement units are designed to allow flushing the shaft bearings with fresh oil. Flushing is recommended where pumps/motors are installed vertically and where operating cycles display long periods at high pressure (> 250 bar).

Recommended flushing flow rates for each nominal size.

DISPLACEMENT	FLUSHING FLOW RATES
20	3lpm [0.8gpm]
30	4lpm [1.1gpm]
40	4lpm [1.1gpm]
55	4lpm [1.1gpm]
75	5lpm [1.3gpm]
87	8lpm [2.1gpm]
108	8lpm [2.1gpm]
161	10lpm [2.6gpm]
225	10lpm [2.6gpm]

Installation Guidelines

The following installation guidelines for Eaton Bent Axis piston motors are designed for standard components applied within catalog ratings. Observing these guidelines below will help ensure acceptable life of the motors.

1. Filling the case

The case of bent axis piston motors must be pre-filled with hydraulic oil before the system is started for the first time.

Use the case drain connection at the highest point to ensure the case remains full at all times. See figure below.

Figure 1 - Filling the case

Caution:

Starting the motor with little or no oil in the case causes immediate and permanent damage to the piston unit.

2. Connections

To reduce noise levels, flexible hoses are recommended (Main system pressure lines as well as case drain lines).

Case drain hoses should be as short as possible.

Minimize pressure drops due to couplings, elbows and differences in diameter.

Where non-flexible tubes are used, ensure that the pipes do not pull on the cover of the motor.

All hoses connected to tank (case drain lines) should be immersed at least 200 mm [8 in.] below the minimum oil level and at least 150 mm [6 in.] from the bottom of the tank.

Drive shaft

Take special care to ensure that mechanical parts of the motor are coupled correctly. Ensure that the shaft and flange are lined up accurately to prevent additional loads on the shaft bearings. Flexible couplings should be used.

Caution: incorrectly aligned parts significantly reduce the service life of the bearings.

Application Information

Installation Guidelines (cont.)

Installation position

Motors may be installed both above and below the level of the fluid in the tank, (lowest level of the oil when the system is operating). When motors are used in open circuit applications, the oil level is affected by the number and size of any hydraulic cylinders used in the system. For mobile installations it is important to take into account the slope of the ground and the effect of centrifugal forces on the oil level.

Installation above the tank

Particular care should be taken when installing units above the tank. Special case drain hoses must always be used to prevent the case from being siphoned out.

Always use the highest case drain port available and ensure that the line is designed such that the motor case remains full at all times.

It is recommended to position a pre-loaded check valve in the cased drain line (maximum pressure when open: 0.5 bar [8 psi]) to prevent oil from draining from the motor case when the system is not in use.

The oil level of the units should be checked at regular intervals. It is essential to check the level if the system is out of service for extended periods of time, since the force of gravity causes oil to drain from the case.

Figure 2 - Installation above the tank

Installation below the tank

Installation below the minimum level of the fluid (or immersed in fluid) does not create particular problems.

Gearbox mount motors should not be installed vertically with the shaft turned upwards.

Flushing

If Bent Axis piston motors are to be installed with shaft turned upwards, or run at high oil temperature inside the tank ($>50^{\circ}\text{C}$), or if units are used for a long operation time at high pressures ($>250\text{ bar}$), it is recommended to flush motor/pump bearings, by using oil at equal or lower temperature than the tank. Flush the bearings through the Port E

Figure 4 - Bearing flushing

Application Information

Installation Guidelines (cont.)

System Start-up.

Before starting system for the first time, fill system components with new and filtered oil. In addition, clean the reservoir and fill with the same type of oil. We recommend flushing the circuit. Verify that charge pressure is correct (closed circuits). Check reservoir level and top-off if necessary.

Closed circuit cleaning procedure

Hydrostatic transmission circuits must be cleaned without load for a period of one hour. Afterwards, remove system pressure hoses from port connections A and B on the motor and connect them together so as to short circuit the pump. Insert a filter in series (working pressure: 50 bar [750 psi]) on the connection A of the pump. Make sure the direction of rotation of the pump ensures the flow as shown by the arrows. If necessary insert a non-return valve. A 10 mm filter in series is recommended.

Maintenance

Replace filter after first 50 hours of operation, and then every 500 hours.

Change oil after first 500 hours of operation. Subsequently change oil every 2000 hours.

Maintenance intervals should be reduced when the filter indicator shows that the filter is dirty or when the system is operated in an especially dusty environment.
