

Pressure reducing valve for subplate mounting type UZRB6 is used to maintain pressure behind the valve constant, on condition that pressure in front of the valve is higher. The valve may also be applied where undesirable pressure increase behind the valve could appear. An additional connection to a tank is then open in order to reduce excessive pressure increase.

**DESCRIPTION OF OPERATION**

The spool 2 is held in neutral position in the housing 1 by the spring 3. At the same time pressure in line A affects the spool surface opposite the spring. The valve is open in initial position. The spring force is set by turning the hand knob 6 of the setting element 5, which is screwed in the sleeve 4. If pressure exceeds the value set at the spring, the spool moves along and reduces the flow from P to A.

Thus larger restriction of the flow will follow and as a result pressure behind the valve will be limited. If pressure in line A continues to rise, connection from P to A is cut off. The spool 2 is pushed further against the spring and line A is connected to T. Oil drains until pressure stops to increase.

**TECHNICAL DATA**

Hydraulic fluid	Mineral oil or phosphate ester
Maximum pressure at line P	31,5 MPa
Maximum pressure at line A ( at T = 0 MPa )	21 MPa
Maximum pressure at line T	1,5 MPa
Nominal fluid viscosity	37 mm <sup>2</sup> /s at temp. 328 K
Viscosity range	2,8 to 380 mm <sup>2</sup> /s
Optimum working temperature ( fluid in a tank )	313 - 328 K
Fluid temperature range	243 - 343 K
Required fluid filtration	16 mm
Recommended fluid filtration	10 mm
Weight	~ 1.4 kg

# OVERALL DIMENSIONS

- 1 - hand knob
- 2 - set screw
- 3 - lockable hand knob
- 4 - O-ring 9.2 × 1.8 - 4 pcs

Required surface finish of the mating subplate.

## OPERATING CURVES, at $v = 41 \text{ mm}^2/\text{s}$ , temp. = 323 K

$P_A = f(Q)$  - output pressure in relation to flow rate

$\Delta p = f(Q)$  - pressure drop at check valve in relation to flow rate

$\Delta p_{Amin} = f ( Q )$  - effect of flow changes in line P-A on output pressure.

If, for example, pressure in line A is set at 3 MPa with flow rate 7 dm<sup>3</sup>/min , output pressure increases to  $P_A = 3.4$  MPa as flow decreases towards  $Q = 0$  dm<sup>3</sup>/min .
